

City of Milpitas

Water Quality in 2013

Consumer Confidence Report issued on June 2014

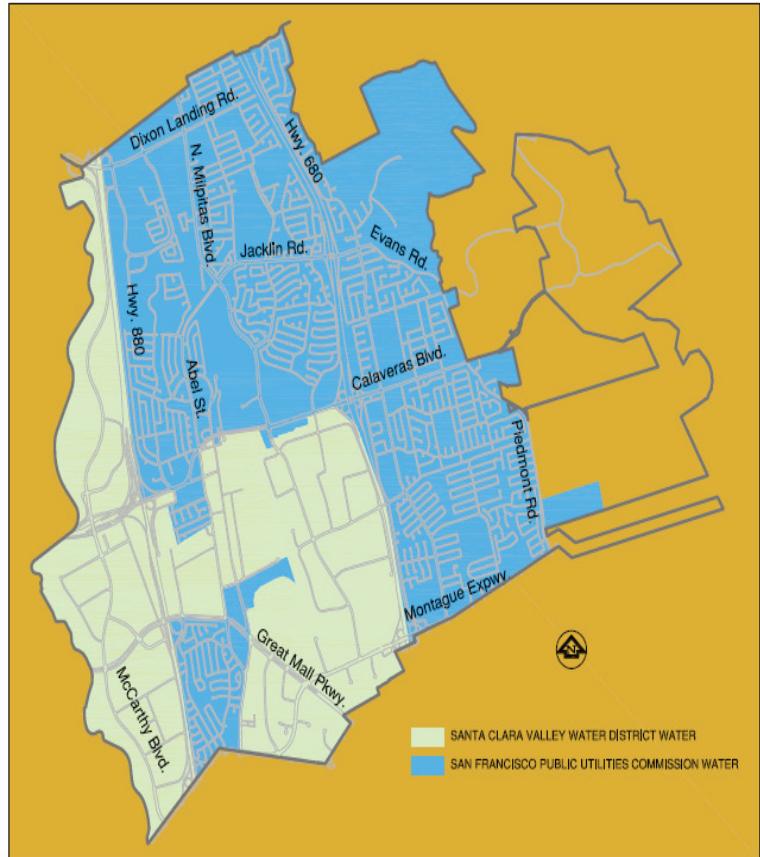

The City of Milpitas is committed to providing a safe and reliable supply of high-quality drinking water that meets Federal and State standards. Each year the City provides a summary of the water quality sampling results and other information through a Consumer Confidence Report in accordance with the Federal Safe Drinking Water Act and California Department of Public Health (CDPH) requirements.

Drinking Water Sources

The City purchases drinking water from two wholesalers: two-thirds from the San Francisco Public Utilities Commission (SFPUC) and one-third from the Santa Clara Valley Water District (SCVWD). SFPUC water is primarily from the Hetch Hetchy watershed located in the Sierra Nevada mountains and is supplemented by water from the Alameda watershed in Calaveras Reservoir and San Antonio Reservoir for filtration and disinfection at the Sunol Valley Water Treatment Plant. SCVWD water is primarily from the Sacramento-San Joaquin Delta watershed via the South Bay Aqueduct, Dyer Reservoir, Lake Del Valle and San Luis Reservoir and is supplemented by local water sources in Anderson and Calero Reservoirs for filtration and disinfection at Penitencia and Santa Teresa Water Treatment Plants. In 2013, the City supplied an average of 9.6 million gallons of water per day to over 16,000 homes and businesses for indoor and outdoor use in Milpitas.

The City serves SFPUC source water to the area south of Calaveras Blvd. and east of I-680, as well as north of Calaveras Blvd. and east of I-880. SCVWD service areas are west of I-880, as well as south of Calaveras Blvd. and west of I-680. Refer to the Water Source Map to view the water service areas.

SFPUC: Some Hillside homes are not shown due to small size on map. They are Spring Valley Heights Subdivision and Ed Levin Park area.

Emergency Supplies

The City does not blend SFPUC and SCVWD waters under normal operating conditions. However, the service areas can be physically interconnected to provide emergency water supply if needed. The City also has emergency interties with Alameda County Water District to the north and San Jose Water Company to the south. SFPUC and SCVWD share an intertie that can supply water from one wholesaler to the other. The City's Pinewood Well, located in the southwestern portion of the City, is also an emergency water supply.

Protecting Water Sources

Drinking Water Source Assessment Program

Drinking Water Source Assessment Programs evaluate the vulnerability of water sources to potential contamination. Drinking water source assessments have been conducted for both of the City of Milpitas' potable water supplies—SFPUC and SCVWD. The assessments are available for review at the California Department of Public Health (CDPH) Drinking Water Field Operations Branch, call (510) 620-3474 for more information.

SFPUC

The SFPUC actively protects the water resources entrusted to its care. It's annual update of Hetch Hetchy Watershed Sanitary Survey evaluates the sanitary conditions, water quality, potential contamination sources, and the results of watershed management activities with partner agencies (such as the National Park Service and US Forest Service). The SFPUC also conducts sanitary surveys every five years to detect and track sanitary concerns for the Bay Area watersheds and the approved standby water sources in Early Intake Watershed, which includes Cherry Lake and Lake Eleanor. The latest 5-year surveys were completed in 2011 for the period of 2006-2010. These surveys identified wildlife, stock, and human activities as potential contamination sources. For additional information, visit the SFPUC website at www.sfwater.org.

SCVWD

The District's source waters are vulnerable to potential contamination from a variety of land use practices, such as agricultural and urban runoff, recreational activities, livestock grazing, and residential and industrial development. The imported sources are also vulnerable to wastewater treatment plant discharges, seawater intrusion, and wild land fires in open space areas. In addition, local sources are also vulnerable to potential contamination from commercial stables and historic mining practices. No contaminant associated with any of these activities has been detected in the District's treated water. The water treatment plants provide multiple barriers for physical removal and disinfection of contaminants. For additional information, visit the District website at www.valleywater.org.

Recycled Water

Recycled Water - Preserving Drinking Water for the Future

In 2013, irrigation and industrial customers in Milpitas used 736,000 gallons of recycled water per day, thereby conserving an equal amount of drinking water. Recycled water from the San Jose/Santa Clara Water Pollution Control Plant undergoes an extensive treatment process (including filtration and disinfection) and is delivered to landscape irrigation and industrial process customers in Milpitas, San Jose and Santa Clara. For more information, please visit the South Bay Water Recycling Program's web site at: <http://www.sanjoseca.gov/sbwr>.

State Water Drought

As the State of California water drought continues, Governor Brown has proclaimed and ordered water agencies to respond. At the release time of this report, SFPUC has a 10% reduction and SCVWD has a 20% reduction. For the latest water drought status, go to the City of Milpitas website at: www.ci.milpitas.ca.gov.

Maintaining Water Quality

Hydrant and Water Main Flushing. Flushing of fire hydrants and water mains is performed to remove sediment and keep the distribution system refreshed. As a result, residents in the immediate vicinity may experience temporary discoloration in their water. This discoloration does not affect the safety of the water. If you experience discoloration in your water after crews have been flushing in your neighborhood, clear the water from your home pipes by running water faucets for a few minutes.

Backflow Testing. Backflow prevention devices keep the water supply safe by ensuring that the water used does not flow back into the City's distribution system. Milpitas sends out notifications and tracks the testing and repair of over 1,800 backflow devices each year.

Water Sampling. Sampling of the water system is also performed to verify the quality. This requires purging of the water line for a sample to be lab tested.

Survey. Site surveys are also performed to ensure the existing water system is also protected from any possible contamination.

Water Quality Monitoring

Fluoride

SFPUC supplies fluoridated water to the City. The fluoride levels in the treated water are maintained within the range required by state regulations. However, the water supplied by SCVWD is not fluoridated. Customers in both SFPUC and SCVWD service areas should check with their dentist to determine if fluoride supplements are still necessary for use. For more information, please visit CDPH's website at: www.cdph.ca.gov/certlic/drinkingwater/Pages/Fluoridation.aspx .

Chloramine

Both SFPUC and SCVWD waters are treated with chloramine to protect public health by destroying disease-causing organisms. Chloramine is considered safe for use as a water disinfectant. However, home dialysis patients and aquarium owners must take precautions before using the chloraminated water in kidney dialysis machines or aquariums. Dialysis patients should consult with their doctor or dialysis technician and aquarium owners should consult with their pet store.

Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using the water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (800) 426-4791 or at: www.epa.gov/safewater/lead .

Radon

Radon is a radioactive gas that you cannot see, taste, or smell and found nationwide. Radon can move up through the ground and into a home through cracks and holes in the foundation. Radon can build up to high levels in all types of homes. Radon can also get into indoor air when released from tap water from showering, washing dishes, and other household activities. Compared to radon entering the home through soil, radon entering the home through tap water will in most cases be a small source. Radon is a known human carcinogen. Breathing air containing radon can lead to lung cancer. Drinking water containing radon may also cause increased risk of stomach cancer. If you are concerned about radon in your home, test the air in your home. Testing is inexpensive and easy. You should pursue radon removal for your home if the level of radon in your air is 4 picocuries per liter of air (pCi/L) or higher. There are simple ways to fix a radon problem that are not too costly. For additional information, call your State radon program (1-800-745-7236), the EPA Safe Drinking Water Act Hotline (1-800-426-4791), or the National Safety Council Radon Hotline (1-800-SOS-RADON).

2013 Water Quality Data

Water Quality Monitoring Results

The City collected over 2,000 drinking water samples for analysis in State-certified laboratories to safeguard the public's health and water supply in 2013. The water supplied in Milpitas has met all EPA and State drinking water health standards in 2013, as shown in the following table, which lists all drinking water constituents that were detected during the 2013 calendar year. Additionally, many other constituents were monitored. Unless otherwise noted, the data presented in this table are for testing done between January 1 and December 31, 2013.

Definitions

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs or MCLGs as is economically and technologically feasible. Secondary MCLs (SMCLs) are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by U.S. Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Notification Level (NL): These are health-based advisory levels established by CDPH for chemicals in drinking water that lack MCLs.

Primary Drinking Water Standard (PDWS): MCLs and MRDLs for contaminants that affect health, along with their monitoring and reporting requirements, and water treatment requirements.

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

DETECTED CONSTITUENTS			MCL	PHG [MCLG]	SCVWD Water ⁽¹⁾	SFPUC Water ⁽²⁾	Typical Sources in Drinking Water
Microorganism							
Total Coliform Bacteria ⁽³⁾	%	5	[0]	0	0	0	Naturally present in environment

Notes:

- (1) Water quality data in SCVWD's transmission system, unless noted as (3)
 (2) Water quality data in SFPUC's transmission system, unless noted as (3)
 (3) Water quality data in the City's distribution system.
 (4) Not used
 (5) Turbidity is a measure of the cloudiness of the water, and is also used to indicate the effectiveness of the filtration system. High turbidity can hinder the effectiveness of disinfectants.
 (6) SFPUC started fluoridating its water in November 2005.
 (7) Precursor for disinfection byproduct formation.
 (8) Lead and copper monitoring was conducted for selected homes and businesses in August 2013. The standard is met if the 90th percentile is less than the action level.
 (9) 29 sites are in SFPUC service area; 6 sites are in SCVWD service area.

How Do Drinking Water Sources Become Polluted?

The sources of drinking water (both tap and bottled water) include rivers, lakes, oceans, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Such substances are called contaminants. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides** that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application and septic systems.
- **Radioactive contaminants** which can be naturally-occurring or be the result of oil and gas production and mining activities.

Be the Solution to Storm Water Pollution

Ever wonder where that storm drain goes? Unlike indoor plumbing, the storm drain carries rainwater and urban pollution directly to our neighborhood creeks and eventually to the San Francisco Bay without treatment! Here are a few simple things you can do to prevent pollution of our creeks and Bay:

- Call the Household Hazardous Waste Program at (408) 299-7300 to make an appointment to dispose household hazardous wastes such as batteries, paints, fluorescent lamps, and used motor oil to your local hazardous waste facilities.
- Sweep up leaves, dirt and waste near curbs and place in the proper bins for recycling or garbage collection.
- Pick up litter. A large portion of the trash in our creeks and Bay starts out as litter on our streets.
- Keep pet waste away from neighborhood streets and storm drains.
- Wash your car at a commercial car wash that recycles water.

In order to ensure that tap water is safe to drink, USEPA and CDPH prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. CDPH regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

What Else Should I Know?

More information about contaminants and potential health effects can be obtained by calling the USEPA'S Safe Drinking Water Hotline (800 426 4791).

Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised people such as those with cancer undergoing chemotherapy, who have undergone organ transplants, HIV/AIDS, other immune system disorders, some elderly people, or infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791 or at www.epa.gov/safewater.

Cryptosporidium* and *Giardia are parasitic microbes found in most surface water. Test methods approved by the USEPA do not distinguish between dead organisms and those capable of causing disease. Filtration and disinfection are common effective treatment methods, but cannot guarantee 100 percent removal. If ingested, these parasites may produce symptoms of nausea, abdominal cramps, diarrhea, and associated headaches. Very low levels were found as shown on the Water Quality Data table on page 4 and are below levels of concern for most people. Most healthy individuals overcome the disease within a few weeks. However, immuno-compromised people are at greater risk. Consult your health provider. *Cryptosporidium* must be ingested to cause disease, and it may be spread through means other than drinking water.

Frequently Asked Questions

Why is my water brown or not clear?

Water sitting in aging household plumbing may become brown. This should clear up once sitting water is flushed out from the pipes and replaced with water that has not been sitting in the pipes. Also check for blocked fixture strainers, dirty filters, and dirty water heater.

Is there fluoride in the water?

See the water service area map on page 1. If you live in the blue colored area for SFPUC, you have fluoridated water. Otherwise, you do not have fluoridated water.

Why has my water pressure dropped suddenly?

Call Milpitas Public Works Dept at (408) 586-2600. You can also check for clogged strainers and proper operation of any pressure regulator (setting). The Water system in the streets varies typically from 40 to 140 psi depending on the location.

If you use water for medical equipment such as a dialysis machine, medical equipment requiring re-calibration if the water quality fluctuates, etc., please provide your email address and contact information (name, address, phone #) to jleung@ci.milpitas.ca.gov with a subject: water medical dependent user.

Emergency Preparedness Resources-Water

In a disaster, water supplies may be cut off or contaminated. Store enough water for everyone in your family to last for at least 3 days. Store one gallon of water, per person, per day. This amount will be adequate for general drinking purposes. Three gallons per person per day is also sufficient for limited cooking and personal hygiene use. If you store tap water, store water in food grade plastic containers. Replace water at least once every six months. If you buy bottled "spring" or "drinking" water, keep it in its original container. Label bottles with their replacement date and store in a cool, dark place.

Treating Water After a Disaster

If you run out of stored drinking water, strain and treat water from your water heater or toilet reservoir tank (except if you use toilet tank cleaners.) You cannot drink swimming pool or spa water, but it can be used for flushing toilets or washing.

Strain large particles by pouring water through a couple of layers of paper towels or clean cloth. Purify the water by:

Boiling: Bring to a rolling boil and maintain for 3-5 minutes. To improve the taste, pour it back and forth between two clean containers to add oxygen back.

Disinfecting: If the water is clear, add 8 drops of bleach per gallon. If it is cloudy, add 16 drops. Shake or stir, then let stand for 30 minutes. A slight chlorine taste and smell is normal.

Water Conservation Tip

Your emergency water supply, whether tap or bottled, has to be replaced every six months. Instead of throwing the old water away, use it to irrigate your plants.

Water Conservation Tips

Ways to conserve indoors:

- Fix leaking faucets, pipes, toilets, etc.
- Do not use the toilet for trash disposal.
- Take shorter showers.
- Do not let the water run while shaving or brushing your teeth.
- Soak dishes before washing.
- Run the dishwasher only when full.
- Install water-saving devices in faucets, toilets and appliances.

Ways to conserve outdoors:

- Water the lawn and garden in the early morning or evening.
- Use mulch around plants and shrubs.
- Repair leaks in faucets and hoses.
- Use water-saving nozzles.
- Use water from a bucket to wash your car or bike and save the hose for rinsing.

HOW CAN I GET INVOLVED?

City Council meetings typically occur on the first and third Tuesday of every month at 7:00 p.m. in the City Hall Council Chambers located at 455 E. Calaveras Blvd. City Council Agendas are posted prior to each meeting at City Hall and on the City's website.

The City is a member of the American Water Works Association and the Bay Area Water Supply and Conservation Agency.
